

A very long time ago, man only used his energy to feed himself and to live, that is he used his own energy to hunt, fish, build his house, make clothing, etc... But with the passage of time, man began to make tools and instruments to do all these tasks easily and he invented tools such as knives and hammers...

These sources of energy also cause a lot of problems, because when we burn them, they produce smoke and gases that damage the environment, that is, they pollute the air that we breathe, harming our health and that of other living beings.

Have you ever watched the black smoke that comes out when the car is started up? This smoke enters the air that we all breathe! Yuck!

Fortunately, we can use other types of energy that are much cleaner: Solar panels can be used to generate electricity from the heat of the sun. This type of energy does not create pollution and is very cheap to produce. The force of the wind can also be used to create electricity. In some places, there are fields of windmills for generating wind-powered electricity. They look like strange forests of gigantic metal trees!

Unlike oil and coal, these sources are inexhaustible. That's why we call them renewable energies, because although we use them they never run out. What good luck!
